

A From skin specimens to three distinct readouts

GSE165816
25 foot specimens

76,461 retained cells

Frozen expression map
15 topics; focus readout
TIMP1/COL3A1/DCN-rich

Fibroblast mean loading

High-state fibroblast fraction

All-cell mean per patient

B What changes the average?

Conceptual illustration: low / high cell states

Fewer high-state cells

More high-state cells

More high-state cells can raise the mean.
Mean-fraction correlation alone cannot prove
unchanged expression within each state.

C How is the interpretation tested?

Technical robustness

Depth matching; stress; immune exclusion

Independent analysis units

14 DFU specimens → 11 patients; paired anatomy

External tissue context

Frozen projection; cohort-specific associations

Cell-state abundance, technical robustness and healing prediction require separate evidence
